Off. Act. Dated: 04/05/2005

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

Claims 1-4 (canceled)

5. (currently amended): ~~A method as recited in claim 4, further comprising: A method for differentiating congestion-related packet loss versus random packet loss in a wireless data connection, comprising:~~

~~monitoring changes in the length of a transmission queue in a wireless data connection;~~

~~designating packet loss as being due to congestion if said packet loss is preceded by an increase in the queue length;~~

~~designating packet loss as random loss if said packet loss is not preceded by an increase in the queue length;~~

~~monitoring changes in the length of said queue over an interval substantially equal to the amount of time it takes to transmit a window of data packets and receive acknowledgements corresponding to all data packets transmitted in the window;~~

initializing a state count to zero;

transitioning from the state count zero to state count one if the length of said queue increases during the next interval;

transitioning from the state count one to state count zero if the length of said queue decreases or remains steady during the next subsequent interval;

transitioning from state count one to state count two if the length of said queue increases during the next subsequent interval; and

designating packet loss as due to congestion if state count two is reached.

Appl. No.: 09/945,106  
Amtd. Dated: 06/16/2005  
Off. Act. Dated: 04/05/2005

6. (original): A method as recited in claim 5, further comprising:  
applying a collision avoidance algorithm if packet loss is designated as due to  
congestion.

7. (original): A method as recited in claim 6, wherein said collision avoidance  
algorithm comprises reducing the sender's transmission window by one-half.

Claims 8-9 (canceled)

10. (currently amended): ~~A method as recited in claim 9, A method for  
differentiating congestion-related packet loss versus random packet loss in a wireless  
data connection, comprising:~~

monitoring changes in the length of a transmission queue in a wireless data  
connection;

designating packet loss as being due to congestion if said packet loss is  
preceded by an increase in the queue length;

designating packet loss as random loss if said packet loss is not preceded by an  
increase in the queue length;

determining whether congestion is developing in the forward or reverse path of  
the connection; and

isolating forward throughput from congestion on the reverse path;

wherein congestion is determined by calculating the relative delay that one  
packet experiences with respect to another as it traverses the connection.

11. (original): A method as recited in claim 10, wherein said relative delay is  
used to estimate the number of packets residing the in the queue.

Appl. No.: 09/945,106  
Amdt. Dated: 06/16/2005  
Off. Act. Dated: 04/05/2005

12. (original): A method as recited in claim 11, further comprising keeping the number of packets in the queue at a minimum level by adjusting a congestion window.

13. (original): A method as recited in claim 12, further comprising: reducing the congestion window if the queue length increases; and increasing the congestion window if the queue length decreases.

14. (original): A TCP-based congestion management protocol for a wireless data connection, comprising:

monitoring changes in the length of a transmission queue in a data connection;  
designating packet loss as being due to congestion if said packet loss is preceded by at least two consecutive intervals of increasing queue length; and  
designating packet loss as random loss if said packet loss is not preceded by at least two consecutive intervals of increasing queue length.

15. (original): A method as recited in claim 14, further comprising: applying a collision avoidance algorithm if packet loss is designated as due to congestion.

16. (original): A method as recited in claim 15, wherein said collision avoidance algorithm comprises reducing the sender's transmission window by one-half.

17. (original): A protocol as recited in claim 16, wherein each said interval comprises the amount of time it takes to transmit a window of data packets and receive acknowledgements corresponding to all data packets transmitted in the window.

18. (original): A protocol as recited in claim 17, further comprising: initializing a state count to zero;

Appl. No.: 09/945,106  
Amdt. Dated: 06/16/2005  
Off. Act. Dated: 04/05/2005

transitioning from the state count zero to state count one if the length of said queue increases during the next interval;

transitioning from the state count one to state count zero if the length of said queue decreases or remains steady during the next subsequent interval;

transitioning from state count one to state count two if the length of said queue increases during the next subsequent interval; and

designating packet loss as due to congestion if state count two is reached.

19. (original): A protocol as recited in claim 18, further comprising:  
applying a collision avoidance algorithm if packet loss is designated as due to congestion.

20. (original): A protocol as recited in claim 19, wherein said collision avoidance algorithm comprises reducing the sender's transmission window by one-half.

21. (original): A protocol as recited in claim 14, further comprising determining whether congestion is developing in the forward or reverse path of the connection.

22. (original): A protocol as recited in claim 21, further comprising isolating forward throughput from congestion on the reverse path.

23. (original): A protocol as recited in claim 22, wherein congestion is determined by calculating the relative delay that one packet experiences with respect to another as it traverses the connection.

24. (original): A protocol as recited in claim 23, wherein said relative delay is used to estimate the number of packets residing in the queue.

Appl. No.: 09/945,106  
Amdt. Dated: 06/16/2005  
Off. Act. Dated: 04/05/2005

25. (original): A protocol as recited in claim 24, further comprising keeping the number of packets in the queue at a minimum level by adjusting a congestion window.

26. (original): A protocol as recited in claim 25, further comprising:  
reducing the congestion window if the queue length increases; and  
increasing the congestion window if the queue length decreases.

Claims 27-29 (canceled)

30. (currently amended): A method as recited in claim 27, further comprising: A method for differentiating congestion-related packet loss versus random packet loss in a wireless data connection, comprising:

monitoring changes in the length of a transmission queue in a wireless data connection over an interval substantially equal to the amount of time it takes to transmit a window of data packets and receive acknowledgements corresponding to all data packets transmitted in the window;

designating packet loss as being due to congestion if said packet loss is preceded by an increase in the queue length;

designating packet loss as random loss if said packet loss is not preceded by an increase in the queue length;

initializing a state count to zero;

transitioning from the state count zero to state count one if the length of said queue increases during the next interval;

transitioning from the state count one to state count zero if the length of said queue decreases or remains steady during the next subsequent interval;

transitioning from state count one to state count two if the length of said queue increases during the next subsequent interval; and

designating packet loss as due to congestion if state count two is reached.

Appl. No.: 09/945,106  
Amdt. Dated: 06/16/2005  
Off. Act. Dated: 04/05/2005

31. (original): A method as recited in claim 30, further comprising:  
applying a collision avoidance algorithm if packet loss is designated as due to  
congestion.

32. (original): A method as recited in claim 31, wherein said collision avoidance  
algorithm comprises reducing the sender's transmission window by one-half.

**Claims 33-34 (canceled)**

35. (currently amended): ~~A method as recited in claim 34, A method for  
differentiating congestion-related packet loss versus random packet loss in a wireless  
data connection, comprising:~~

monitoring changes in the length of a transmission queue in a wireless data  
connection over an interval substantially equal to the amount of time it takes to transmit  
a window of data packets and receive acknowledgements corresponding to all data  
packets transmitted in the window;

designating packet loss as being due to congestion if said packet loss is  
preceded by an increase in the queue length;

designating packet loss as random loss if said packet loss is not preceded by an  
increase in the queue length;

determining whether congestion is developing in the forward or reverse path of  
the connection; and

isolating forward throughput from congestion on the reverse path;  
wherein congestion is determined by calculating the relative delay that one  
packet experiences with respect to another as it traverses the connection.

Appl. No.: 09/945,106  
Arndt. Dated: 06/16/2005  
Off. Act. Dated: 04/05/2005

**36. (original): A method as recited in claim 35, wherein said relative delay is used to estimate the number of packets residing the in the queue.**

**37. (original): A method as recited in claim 36, further comprising keeping the number of packets in the queue at a minimum level by adjusting a congestion window.**

**38. (original): A method as recited in claim 37, further comprising:**  
**reducing the congestion window if the queue length increases; and**  
**increasing the congestion window if the queue length decreases.**

**39. (original): A TCP-based congestion management protocol for a wireless data connection, comprising:**

**monitoring changes in the length of a transmission queue in a data connection over an interval substantially equal to the amount of time it takes to transmit a window of data packets and receive acknowledgements corresponding to all data packets transmitted in the window;**

**designating packet loss as being due to congestion if said packet loss is preceded by at least two consecutive intervals of increasing queue length; and**

**designating packet loss as random loss if said packet loss is not preceded by at least two consecutive intervals of increasing queue length.**

**40. (original): A method as recited in claim 39, further comprising:**  
**applying a collision avoidance algorithm if packet loss is designated as due to congestion.**

**41. (original): A method as recited in claim 40, wherein said collision avoidance algorithm comprises reducing the sender's transmission window by one-half.**

Appl. No.: 09/945,106  
Amtd. Dated: 06/16/2005  
Off. Act. Dated: 04/05/2005

42. (original): A protocol as recited in claim 41, further comprising:  
initializing a state count to zero;  
transitioning from the state count zero to state count one if the length of said queue increases during the next interval;  
transitioning from the state count one to state count zero if the length of said queue decreases or remains steady during the next subsequent interval;  
transitioning from state count one to state count two if the length of said queue increases during the next subsequent interval; and  
designating packet loss as due to congestion if state count two is reached.

43. (original): A protocol as recited in claim 42, further comprising:  
applying a collision avoidance algorithm if packet loss is designated as due to congestion.

44. (original): A protocol as recited in claim 43, wherein said collision avoidance algorithm comprises reducing the sender's transmission window by one-half.

45. (original): A protocol as recited in claim 39, further comprising determining whether congestion is developing in the forward or reverse path of the connection.

46. (original): A protocol as recited in claim 45, further comprising isolating forward throughput from congestion on the reverse path.

47. (original): A protocol as recited in claim 46, wherein congestion is determined by calculating the relative delay that one packet experiences with respect to another as it traverses the connection.

Appl. No.: 09/945,106  
Amdt. Dated: 06/16/2005  
Off. Act. Dated: 04/05/2005

48. (original): A protocol as recited in claim 47, wherein said relative delay is used to estimate the number of packets residing the in the queue.

49. (original): A protocol as recited in claim 48, further comprising keeping the number of packets in the queue at a minimum level by adjusting a congestion window.

50. (original): A protocol as recited in claim 49, further comprising:  
reducing the congestion window if the queue length increases; and  
increasing the congestion window if the queue length decreases.

51. (original): A method for improving TCP performance over a wireless connection, comprising:

detecting the initial stages of congestion in the connection, and identifying the direction of the congestion;

determining whether congestion is developing in the forward or reverse path of the connection;

isolating the forward throughput from events such as congestion that may occur on the reverse path;

determining congestion by calculating the relative delay that one packet experiences with respect to another as it traverses the network;

using said relative delay to estimate the number of packets residing in a bottleneck queue;

keeping the number of packets in the bottleneck queue at a minimum level by adjusting the TCP source's congestion window;

reducing the congestion window if the bottleneck queue length increases; and  
increasing the congestion window when the source detects additional bandwidth availability in the connection.
